                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RNA-binding protei
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         nitrilotriacetate
                                                                                                                                                                                                                                                                                                                                                                                                                                         Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The invention relates to human PRP-1-derived oligopeptides (AAB48771-AAB48783) which contain at least two arginine residues and which protect against dental caries. PRPS (proline-rich proteins) are salivary proteins encoded by six clustered genes on chromosome 12p13.2 and are potential determinants of a person's susceptibility to dental caries. PRPs are determinants of a person's susceptibility to dental caries. PRPs are fragments. These are metabolised by oral bacteria for nutritional purposes, with certain bacterial species generating ammonia via the catabolism of arginine. The peptides of the invention, being arginine-rich, can also be converted to ammonia by these bacteria. The ammonia thus formed raises the pH at the dental surface, thereby protecting the teeth against caries. Sequences AAB48771-B48783 represent the PRP-1-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to human PRP-1-derived cligopeptides (AAB48771-ABA848783) which contain at least two arginine residues and which protect against dental caries. PRPs (proline-rich protedins) are salivary proteins encoded by six clustered genes on chromosome 12p13.2 and are potential determinants of a person's susceptibility to dental caries. PRPs are degraded by Actinomyces and Streptococcus species to small peptide tragments. These are metabolised by oral bacteria for nutritional purposes, with certain bacterial species generating ammonia via the catabolism of arginine. The peptides of the invention, being arginine-tich, can also be converted to ammonia by these bacteria. The ammonia thus formed raises the pH at the dental surface, thereby protecting the teeth against caries. Sequences AAB48771-B48783 represent the PRP-1-derived oligopeptides of the invention
                                                                  .
                                                                                                                                                                                                                                                                     Human, PRP-1; proline-rich protein, saliva, dental caries,

The invention relates to human PRP-1-derived oligopeptides (AAB48771-AAB48783) which contain at least two arginine residues and which protect against dental caries. PRPs (proline-rich proteins) are salivary proteins encoded by six clustered genes on chromosome 12p13.2 and are potential determinants of a person's susceptibility to dental caries. PRPs are degraded by Actinomyces and Streptococcus species to small peptide fragments. These are metabolised by oral bacteria for mutritional purposes, with certain bacterial species generating ammonia via the catabolism of arginine. The peptides of the invention, being arginine-rich, can also be converted to ammonia by these bacteria. The ammonia thus formed raises the pH at the dental surface, thereby protecting the teeth against caries. Sequences AAB48771-B48783 represent the PRP-1-derived oligopeptides of the invention
                                                                                                                                                 Human, PRP-1, proline-rich protein, saliva, dental caries,
chromosome 12p13.2, arginine catabolism, ammonia production, pH increase,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New oligopeptides comprising 2 arginine residues from degradation of proline-rich proteins, useful for preventing dental caries.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SX T T X D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X Y D X
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to human PRP-1-derived oligopeptides (AAB48771-AAB48783) which contain at least two arginine residues and which protect against dental caries. PRPs (proline-rich proteins) are salivary proteins encoded by six clustered genes on chromosome 12p13.2 and are potential determinants of a person's susceptibility to dental caries. PRPs are degraded by Actinomyces and Streptococcus species to small peptide fragments. These are metabolised by oral bacteria for nutritional purposes, with certain bacterial species generating ammonia via the catabolism of arginine. The peptides of the invention, being arginine-rich, can also be converted to ammonia by these bacteria. The ammonia thus formed raises the pH at the dental surface, thereby protecting the teeth against caries. Sequences AAB48771-B48783 represent the PRP-1-derived oligopeptides of the invention
chromosome 12p13.2; arginine catabolism; ammonia production; pH increase; oral bacterium; caries prevention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, PRP-1; proline-rich protein; saliva; dental caries;
chromosome 12p13.2; arginine catabolism; ammonia production; pH increase;
oral bacterium; caries prevention.
                                                                                                                                                                                                                                                                                                                                                                                                                            New oligopeptides comprising 2 arginine residues from degradation of proline-rich proteins, useful for preventing dental caries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to human PRP-1-derived oligopeptides (ABB48771-AAB48783) which contain at least two arginine residues and which protect against dental caries. PRPS (proline-rich proteins) are salivary proteins encoded by six clustered genes on chromosome 12p13.2 and are potential determinants of a person's susceptibility to dental caries. PRPs are degraded by Actinomyces and Streptococcus species to small peptide fragments. These are metabolised by oral bacteria for mutritional purposes, with certain bacterial species generating ammonia via the catabolism of arginine. The peptides of the invention, being arginine-rich, can also be converted to ammonia by these bacteria. The ammonia thus formed raises the pH at the dental surface, thereby protecting the teeth against caries. Sequences AAB48771-B48783 represent the PRP-1-derived oligopeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, PRP-1, proline-rich protein, saliva, dental caries,
chromosome 12p13.2, arginine catabolism, ammonia production; pH increase,
oral bacterium, caries prevention.

The invention relates to human PRP-1-derived oligopoptides (AAB48771-ABA84878) which contain at least two arginine residues and which protect against dental caries. PRPs (proline-rich proteins) are salivary proteins encoded by six clustered genes on chromosome 12p13.2 and are potential determinants of a person's susceptibility to dental caries. PRPs are degraded by Actinomyces and Streptococcus species to small peptide fragments. These are metabolised by oral bacteria for nutritional purposes, with certain bacterial species generating ammonia via the catabolism of arginine. The peptides of the invention, being arginine-rich, can also be converted to ammonia by these bacteria. The ammonia thus formed raises the pH at the dental surface, thereby protecting the teeth against caries. Sequences AAB48771-B48783 represent the PRP-1-derived oligopeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, nootropic, neuroprotective, cytostatic, dermatological; virucide, immunosuppressive, antihafammatory; anti-Hry; antibacterial; vulnerary; antiparkinsonian, antisickling; antianaemic; antiarthritic; cancer; antirheumatic; hepatotropic; cerebroprotective; antiinflammatory; antiparalisegic; antidiabelic; antiuhcer; antionulsant, antignal; antiparasitic; cardiant; immune discorder; cardiovascular discrete; neurological disease; infection; nephrotropic; gene therapy; vaccine.

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNs sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hyportrosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention
                                                                                                       SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful fureating acne vulgaris.

```

The invention relates to novel genes (ABQ92553-ABQ92607) and proteins (ABP62013-ABP62153) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in

Claim 11; Page 54; 785pp; English.

disorders

New polynucleotides and polypeptides useful for diagnosing, prognosing, treating or preventing e.g. neurodegenerative, central nervous system, autoimmune, respiratory, reproductive, or inflammatory diseases or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     encoding a Propionibacterium acres protein. The invention also relates to polypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to immunogenic fragments of P. acres polypeptides. The invention additionally encompasses expression vectors and host cells comprising a polynucleotide of the invention, antibodies against polypeptides of the invention, itusion proteins comprising a polypeptide of the invention, a method for stimulating an immune response specific for a P. acres polypeptide of the invention, a polypeptide of the invention; a this method; a vaccine composition (comprising P. acres polypeptides, polynucleotides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit for detecting or determining the presence or absence of P. acres in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
                                                                                 used as
and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for Pr acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated polynucleotide (ACF64435-ACF64733)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Maisonneuve JL;
Jones R; Carter D;
                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Propionibacterium acnes predicted ORF-encoded polypeptide #14844.
                                                                                                                                                                                                                                                                                                        ö

ô
patient, and a method for inhibiting the development of P. acnes in a pratient. The P. acnes polypeptides, polymuclectides, attibodies, fusion proteins, T cell populations or antigen-presenting cells that express the polypeptides are useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein. The polymuclectides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the stimulation of an immune response against P. acnes, or for treating acne, and the kit is useful for performing a diagnostic assay. The present sequence represents a polypeptide predicted to be encoded by an ORF (open reading frame) contained within the P. acnes polymuclectides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the trearment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and oeteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SAPHO syndrome, synovitis, acne, pustulosis, hypertosis, osteomyelitis, uveitis, endophthalmitis, bone, joint, central nervous system; ELISA, inflammatory lesion, acne vulgaris; enzyme linked immunosorbent assay;

nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting ample with a binding agent that binds to the production of the invention of and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as therefore treat P. acnes infections. The antibodies may also be used as changenetic agents for determining P. acnes presence, for example, by any consyme linked immunosorbent assay (BLISA). Note: The sequence data for this patient did not form part of the printed specification, but was to wipo int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Maisonneuve JL;

The invention relates to an isolated polynucleotide (ACF64435-ACF64733) encoding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polynucleotides (ABM64516) and to immunogenic fragments of P. acraes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a polynucleotide of the invention; antibodies against polypeptides of the invention; fusion proteins comprising a polypeptide of the invention; a method for stimulating an immune response specific for a P. acnes polypeptide and an isolated T cell population comprising T cells prepared

Example 1; SEQ ID NO 1819; 1481pp; English.

```
cc via this method, a vaccine composition (comprising P. acnes polypeptides, colymucleotides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit for detecting or determining the presence or absence of P. acnes in a patient, and a method for inhibiting the development of P. acnes in a patient. The P. acnes polypeptides, polymucleotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the polypeptides are useful for diagnosing, preventing or treating acnes polypeptides are useful for diagnosing, preventing or treating acnes protein. The polymucleotides can also be used as probes or primers for convolaris, or for trimulating an immune response spenies probes or primers for stimulation of an immune response against P. acnes, or for treating acne, and the kit is useful for performing a diagnostic assay. The present sequence represents a polypeptide predicted to be encoded by an ORF (open sequence represents a polypeptide predicted to be encoded by an ORF (open reading frame) contained within the P. acnes polymucleotides of the remained methor. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly com WIPO at fip. wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   o.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequences AAU39105-AAU68017 represent Propionibacterium acnes imminogenic polypeptides. The proteins and their associated DNA sequences are used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SAPHO syndrome, synovitis, acne, pustulosis, hypertosis, osteomyelitis, uveitis, endophthalmitis, bone, joint, central nervous system; ELISA; inflammatory lesion, acne vulgaris; enzyme linked immunosorbent assay;

the treatment, prevention and diagnosis of medical conditions caused by a canes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), weitis and endophthalmitis.

P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acme vulgarie. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and client proteins. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (EliSA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the production, but was fire whipo.int/pub/published_pot_sequences 88888888888888888888888888

New Propionibacterium acnes polypeptides and polymucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein. Example 1; SEQ ID NO 17880; 1481pp; English

The invention relates to an isolated polynucleotide (ACF64435-ACF64733) encoding a Propionipacterium acnes protein. The invention also relates to polypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a

polymuclectide of the invention, antibodies against polypeptides of the invention; fusion proteins comprising a polypeptide of the invention; a method for stimulating an immune response specific for a P. acnes polypeptide and an isolated T cell population comprising T cells prepared via this method; a vaccine composition (comprising P. acnes polypeptides, polymuclecitées, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit for detecting or determining the presence or absence of P. acnes in a patient. The P. acnes polypeptides, polymuclecitées, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the proteins. T cell populations or antigen-presenting cells that express the proteins. The polymuclecitées polymuclecitées, antibodies, fusion proteins. The polymuclecitées can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the cumulation of an immune response against P. acnes, or for treating acne, and the kit is useful for performing a diagnostic assay. The present sequence represents a polypeptide predicted to be encoded by an ORF (open reading frame) contained within the P. acnes polymuclecides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly communicatives.

New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.

Claim 7; SEQ ID NO 30474; 1481pp; English.

The invention relates to an isolated polynucleotide (ACF64435-ACF64733) encoding a Propionibacterium acnes protein. The invention also relates to

Claim 20; SEQ ID NO 48637; 103pp; English.

```
municipantic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a polymucleotide of the invention; antibodies against polypeptides of the invention; antibodies against polypeptides of the invention; antibodies against polypeptide of the invention; antibodies against polypeptide of the invention; and polypeptide of the invention; and polypeptide of the invention; and this method for stimulating an immune response specific for a P. acnes polypeptide and an isolated T cell population comprising T cells prepared via this method; a vaccine composition (comprising P. acnes polypeptides, polypeptides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptides of method and kit for determining the development of P. acnes in a patient. The P. acnes polypeptides, polymenting or treating acnes proteins, T cell populations or antigen-presenting cells that express the proteins, T cell populations or antigen-presenting cells that express the proteins, T cell populations or antigen-presenting cells that express the proteins, T cell populations or antigen-presenting cells that express the proteins, or for stimulating an immune response specific for a P. acnes protein. The polymucleotides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for performing a diagnostic assay. The present cand the kit is useful for performing a diagnostic assay. The present chought to contain an immunogenic region. Note The sequence data for the primer fo
polypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; chromosome mapping; gene mapping; gene therapy; forensic

The invention relates to isolated polymuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cutivity of (II) as useful in gene therapy techniques to restore normal cutivity of (II) and to to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of polypeptide and polymuclectide sequences have applications in disposatics, forensics, gene mapping, identification of mutations in disposatics for genetic disorders or other traits to assess biodiversity responsible for genetic disorders or other traits to assess biodiversity and to polypeptide and polymuclecties sequences have applications in disposatic amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

Patent No. 6551795
GENERAL INFORMATION:
APPLICANT: MARC J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS;
TITLE OF INVENTION: NUMBER: US/08/252,991A
CURRENT APPLICATION NUMBER: US/08/252,991A
CURRENT APPLICATION NUMBER: US/08/252,991A
PRIOR PLICATION NUMBER: US 60/074,788
PRIOR PELICATION NUMBER: US 60/094,190
PRIOR PELICATION NUMBER: US 60/094,190
PRIOR PELICATION NUMBER: 1998-02-18
PRIOR PELING DATE: 1998-07-27
NUMBER OF SEQ ID. NOS: 33142
SEGO ID NO 19798
LENGTH: 302
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

APPLICANT: Marc J. Rubenfield et al.
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS TITLE OF INVENTION: APRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.136
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18
PRIOR FILING DATE: 1999-02-18
PRIOR FILING DATE: 1999-02-18
PRIOR FILING DATE: 1999-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 21451
LENGTH: 195
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 29505, Application US/09252991A
Patent No. 6551795
GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPBUTICS
FILE REFERENCE: 107196.136
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   NAME/KEY: UNSURE

1 LOCATION: (128)

7 OTHER INFORMATION: Identity of amino acid at the above locations are unknown.

"A frequent mutation in the acidic proline-rich protein gene, PRH2,
causing a Q147K change closely adjacent to the bacterial binding
domain of the cognate salivary PRP (Prl') in Afro-Americans.";
Hum. Mutat. 12:72-72(1998).
-!- FUNCTION: PRP's act as highly potent inhibitors of crystal growth
-!- FUNCTION: PRP's act as highly potent inhibitors and reparative
of calcium phosphates. They provide a protective and reparative
environment for dental enamel which is important for the integrity

PTM: Proteolytically cleaved; PRP-2, PRP-1, and PIF-S yield PRP-4, PRP-3 (protein A), and PIF-F, respectively.

POLYMORPHISM: Allele PRH1-4 is also known as PRH1 DA allele; allele PRH2-1 is also known as PRI or protein C; allele PRH2-3 is also known as PRI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SECUENCE OF 123-166 (PEPTIDE P-C).

Biochem. J. 330:513-519(1998).

-!- FUNCTION: MAY MODULATE THE INTERNALIZATION OF BETA-AMYLOID
PRECURSOR PROTEIN.

-!- SUBUNIT: BINDS TO THE INTRACELLULAR DOMAIN OF THE BETA-AMYLOID
PRECURSOR PROTEIN. ALSO BIND TO APP-LIKE PROTEINS.

-!- TISSUE SPECIFICITY: EXPESSED PREDOMINANTLY IN BRAIN AND TESTIS.

-!- SIMILARITY: CONTAINS 1 WM domains.

-!- SIMILARITY: CONTAINS 2 PID domains.

Seems to bind and regulate the promoters of MMP1, MMP3, MMP7 and COLIA1 (By similarity).
-!- SUBUNIT: Interacts with Cas (By similarity).
-!- SUBCELLULAR LOCATION: Nuclear (By similarity).

-!- FUNCTION: ATP Sulfurylase may be the GTPase, regulating ATP sulfurylase activity (By similarity).

-!- FUNCTION: APS kinase catalyzes the synthesis of activated sulfate.

-!- FUNCTION: APS kinase catalyzes the synthesis of activated sulfate.

-!- FUNCTION: APS KINASE AT + sulfate = diphosphate + adenylylsulfate.

-!- CALLYTIC ACTIVITY: ATP + adenylylsulfate = ADP + 3'-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            subunit 1 (EC 2.7.7.4) (Sulfate adenylate transferase) (SAT) (ATP-sulfurylase large subunit); Adenylylsulfate kinase (EC 2.7.1.25) (APS kinase) (ATP adenosine-5'-phosphosulfate 3'-phosphotransferase)).

1. Mol. Biol. 295:225-237(2000).

1. FUNCTION: Produces nitric oxide (NO) which is a messenger molecule with diverse functions throughout the body. In the brain and peripheral nervous system, NO displays many properties of a neurotransmitter. Isoform NNOS Mu may be an effector enzyme for the dystrophin complex.

1. CATALYTIC ACTIVITY: L-arginine + N NADPH + M O(2) = citrulline + nitric oxide + N NADP(+)

1. COPACTOR: Heme. Binds one mole each of FAD and FAN. Also requires tetrahydrobiopterin (BH4) which may stabilize the dimeric form of the enzyme (By similarity).

1. ENZYME REGULATION: Stimulated by calcium/calmodulin. Inhibited by n-Nos-inhibiting protein (BHN) which may prevent the dimerization of the protein (By similarity).

2. SUBCELLULAR LOCATION: Interacts with DiG4.

3. SUBCELLULAR LOCATION: In skeletal muscle, it is localized beneath dystrophin glycoprotein complex.

Sequence Nos Win Synonyms-Muscle-specific;

Isold=Q9Z074-4; Sequence=VSP_00357;

Name=NNOS Win; Synonyms-Muscle-specific;

Isold=Q9Z074-4; Sequence=VSP_00357;

Isold=Q9Z074-5; Sequence=VSP_00357;

Sequence=VSP_00357;

TISSUE SPECIFICITY: Widely expressed in the nervous system:
expressed in cerebrum, olfactory bulb, hippocampus, midbrain,
cerebellum, pons, medulla oblongata, and spinal cord. Also found
in skeletal muscle, where it is localized beneath the sarcolemm
of fast twitch muscle, where it is localized beneath the sarcolemm
of fast twitch muscle, where it is localized beneath the sarcolemm
of fast twitch muscle, where it is localized beneath the sarcolemm
of fast twitch muscle, where it is localized beneath the sarcolemm
of fast twitch muscle, where it is localized beneath the sarcolemm
of fast twitch muscle fibers, and in all parts of the nervous
the brain and NNOS beta expression is developmentally regulated.

NNOS Mu is only found in mature skeletal and cardiac muscles.

INDUCTION: By cholinergic agonists acting at inositel phosphate-
liked muscastinic receptors in cardiac mycoytes.

INDUCTION: By cholinergic agonists acting at inositel phosphate-
liked muscastinic receptors in cardiac mycoytes.

ISONOR Mu is only found in mit the N-terminal part of the neuronal isoform participates in protein-protein interaction, and is responsible for targeting nNos to synaptic membranes in muscles.

JOMAIN: The PDZ domain in the N-terminal part of the neuronal stream and accumulates in the cytosol.

SIMILARITY: Contains I flavodoxin-like domain.

SIMILARITY: Contains I flavodoxin-like domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Isold=Q9Z0J4-3; Sequence=VSP_003575, VSP_003576;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Event=Alternative splicing; Named isoforms=5;

```
Event-Alternative splicing; Named isoforms=4;

Comment=Isoform 3 is produced by different alternative splicing events implicating either the untranslated exons TERI (TNNOS) overtes implicating either the untranslated exons TERI (TNNOS) or TEXIB (TNNOS) leading to a N-terminus truncated protein which possesses enzymatic activity comparable to that of isoform 1. The C-terminal truncated isoform 4 is produced by insertion of the TEX2 exon between exons 3 and 4 of isoform 1, leading to a frameshift and a premeture stop codon;

truncated nitric-oxide synthase.";
J. Biol. Chem. 272:11392-11401(1997).
-!- FUNCTION: Produces nitric oxide (NO) which is a messenger molecule
with diverse functions throughout the body. In the brain and
paripheral nervous system, NO displays many properties of a
neurotransmitter.
-!- CATALYTIC ACTUVITY: L-arginine + N NADPH + M O(2) = citrulline +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SUBDIVITY FORGINGER. Interacts with DLG4 (By similarity). Forms a ternary complex with CAPON and RASD1.
SUBCELLUIAR LOCATION: In skeletal muscle, it is localized beneath the sarcolemma of fast-twitch muscle fiber by associating with the

Dolichol-phosphate mannosyltrases (EC 2.4.1.83) (Dolichol-phosphate mannosyltrase) (Dolichyl-phosphate beta-D-mannose synthase) (Dolichyl-phosphate beta-D-mannosyltransferase) (Mannose-P-dolichol synthase) (MPD synthase)
                                                                                                                                                                                                                                                                                                                                                                                                                                                              which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                               -:- FUNCTION: Transfers mannose from GDP-mannose to dolichol
-:- FUNCTION: Transfers mannose from dolichol phosphate mannose (Dol-P-Man)
is the mannosyl donor in pathways leading to N-glycosylation,
glycosyl phosphatidylinositol membrane anchoring, and O-
-- CARANYIC ACTIVITY: GDP-mannose + dolichyl phosphate = GDP +
dolichyl D-mannosyl phosphate.
--- PATHWAY: Glycosylation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cricetulus griseus (Chinese hamster).
